PROFESSIONAL SUMMARY

Founding-minded full-stack engineer with 10+ years building production software and recent deep ownership of OpenPlanner and Knoxx: a graph-backed, multi-tenant AI agent workbench spanning React, TypeScript/Node, Fastify, ClojureScript, PostgreSQL, Redis, WebSockets, OAuth, MCP tools, semantic memory, and LLM-integrated agent workflows. Strong fit for an early third-engineer role: set architecture, ship daily across the stack, keep systems observable, and turn ambiguous product needs into working software.

SKILLS

Frontend: React, TypeScript, Vite, React Router, WebSockets, real-time streaming UI, admin/workbench UX, Vitest/Testing Library.

Backend: TypeScript/Node.js, Fastify, ClojureScript/shadow-cljs, REST APIs, WebSockets, PostgreSQL, Redis, MongoDB, Docker Compose.

AI / agents: RAG and semantic-memory systems, tool-calling agents, MCP, OpenAI-compatible APIs, passive context hydration, run receipts, embeddings/vector search, graph traversal.

Architecture: early-stage product architecture, contract-oriented design, auth/RBAC, multi-tenancy, reliability, observability, CI, test strategy.

PROFESSIONAL EXPERIENCE

Open Hax – OpenPlanner / Knoxx — Founder / Principal Engineer

2026 – Present

- Built and directed OpenPlanner, a graph-stack monorepo for semantic graph construction, traversal, layout, vector search, document/event projection, and agent memory APIs.
- Led Knoxx, a full-stack AI agent runtime/workbench with a React/Vite frontend and CLJS/Node/Fastify backend; current source spans more than 60k lines across frontend and backend application code.
- Designed the agent workbench product surface: live chat orchestration, websocket token streaming, passive hydration, witness/source panels, tool receipts, run history, scratchpad/artifact surfaces, and steer/follow-up controls.
- Implemented GitHub OAuth, Redis-backed cookie sessions, invite-based provisioning, bootstrap admin seeding, org context, and secure API route protection.
- Built the PostgreSQL control-plane foundation for multi-tenant RBAC: orgs, users, built-in roles, permission atoms, role assignments, tool policies, user overrides, data lakes, and admin APIs.
- Drove contract-oriented backend architecture so agents, actors, roles, capabilities, models, tool policies, triggers, and materialization rules are explicit EDN contracts instead of scattered runtime assumptions.
- Integrated MCP as both a Knoxx tool-ingestion path and an OAuth-protected HTTP MCP facade, enabling agents and external clients to discover/call governed tools under role-based policy.
- Built tenant/source-scoped ingestion contract surfaces for source drivers, scheduling, sink routing, semantic graph enrichment, translation, projection metadata, and backpressure policies.
- Hardened runtime reliability: shadow-cljs build/test/lint flows, CLJS backend bootstrap for Node built-ins, dockerized non-root runtime, nREPL/PM2 dev loops, streaming duplication fixes, and session persistence repairs.

Open Hax – Proxx / LLM Infrastructure — Founder / Maintainer

2024 – Present

- Built an OpenAI-compatible multi-provider LLM gateway routing model-prefixed requests across OpenAI, Anthropic, and Ollama-style APIs with token auth, request translation, streaming, and semantic session recall.
- Implemented OAuth/account ingestion, provider-scoped rotation on rate limits, request/response normalization, reasoning trace preservation, and local/remote model routing.

Raft Technologies — Full Stack Engineer (Python/Django + React)

Jul 2020 – Sep 2023

- Built and maintained 5-stage Celery pipelines for uploaded-file processing: parse, validate, summarize, error reports, and notifications with safe failure modes and operational visibility.
- Implemented file type/encoding detection and ClamAV REST anti-malware scanning with retry/backoff, timeouts, persisted outcomes, and auditability.
- Supported React application work and Cypress/Gherkin E2E automation in CI against deployed federal/DoD environments.

CloudApp — Full Stack Engineer (Ruby on Rails)

Sep 2018 – Feb 2019

- Integrated a proprietary OCR service into a screenshot platform and shipped interactive OCR UX: render bounding boxes over screenshots and click to extract recognized text.

Additional experience: 1brand (Full Stack Engineer, 2019–2020); Birdseed (Full Stack Engineer, 2019); Freelance Software Engineer (2014–Present).

Education: Valley Springs High School — Diploma (2012).

Work authorization: Authorized to work in the U.S. for any employer. Willing to relocate.
